SPECTRO Series

SPECTRO-3-30-BL/YL-MSM-ANA

- Color control of different luminescent colors
- Detection of visible light in the upper wavelength range (as of green) of objects that fluoresce under blue light
- Working distance typ. 10 mm ... 50 mm
- L*a*b* , L*C*h* , L*u*v*, L*u'v' and xyY evaluation (CIE standard)
- Up to 3 colors can be taught
- 9x LED blue, 450 nm (AC- or DC-operation can be switched)
- Insensitive to outside light (in AC-operation)
- Scan frequency max. 90 kHz (in DC-operation)
- Switching frequency typ. 60 kHz
- 3 analog outputs to output color values to PLC
- 2 digital outputs to output taught colors
- TEACH via PC or external input
- Various evaluation algorithms can be activated
- "BEST HIT" mode ("human color assessment")
- Averaging can be activated (from 1 up to over 32000 values)
- Parameterizable via Windows® software, scope function
- RS232 interface (USB or Ethernet converter available)
- Temperature compensated
- 3-color filter detector (true color detector: "human color perception")
- Integrated cooling device for protection against overheating of the sensor

Measuring Principle

Measuring principle of color sensors of SPECTRO-3-...-MSM-ANA Series:

The SPECTRO-3-MSM-ANA color sensor provides highly flexible signal acquisition. For example, the sensor can be operated in alternating-light mode (AC mode), which makes the sensor insensitive to extraneous light. It also can be set to constant-light mode (DC mode), which makes the sensor extremely fast. With the stepless adjustment of the integrated light source as well as the selectable gain of the receiver signal and an INTEGRAL function the sensor can be set to almost any surface or any "self-luminous object".

When the integrated light source of the SPECTRO-3-MSM-ANA color sensor is activated, the sensor detects the radiation that is diffusely reflected from the object. As a light source the SPECTRO-3-MSM-ANA color sensor uses LEDs (in case of color sensor type -VISUV additional UV LEDs) with adjustable transmitter power. An integrated 3-fold receiver for the red, green, and blue content of the light that is reflected from the object, or the light that is emitted by a "self-luminous object", is used as a receiver.

The SPECTRO-3-MSM-ANA color sensor can be "taught" up to 3 colors. For each of these taught colors it is possible to set tolerances. Evaluation of the taught colors is performed either with the "FIRST HIT" or with the "BEST HIT" mode. With "FIRST HIT" the first hit in the teach table is output, and with "BEST HIT" the best hit in the teach table is output. Raw data are represented with 12 bit resolution.

Color detection either operates continuously or is started through an external PLC trigger signal. The respective detected color either is provided as a binary code at the 2 digital outputs or can be sent directly to the outputs, if only up to 2 colors are to be detected.

In addition to the 2 digital outputs there also are 3 analog outputs that either provide the red, green, and blue components or the calculated color coordinates in values of 0...+10V or 4...20mA.

Through input IN0 (green wire of the cab-las8/SPS cable) the color sensor can be taught up to 3 colors. For this purpose the corresponding parameter mode must be set with the software.

Parameters and measurement values can be exchanged between a PC and the SPECTRO-3-MSM-ANA color sensor through the serial RS232 interface. All the parameters for color detection also can be saved to the non-volatile EEPROM of the SPECTRO-3-MSM-ANA color sensor through this serial RS232 interface. When parameterisation is finished, the color sensor continues to operate with the current parameters in STAND-ALONE mode without a PC.

Possible firmware updates can be easily performed through the RS232 interface, even with the sensor system in installed condition. (a firmware update is performed via the software "FirmwareLoader").

The measuring sensors of the SPECTRO-3-MSM-ANA series are factory calibrated. When establishing the connection, the date of the next calibration is displayed in the status window in the CONNECT tab. For continuously accurate measurement results, we recommend having the calibration renewed every 12 months and sending in the sensors for calibration.

Moreover, the sensors of the SPECTRO-3-MSM-ANA series can be individually calibrated. Calibration can be performed to any surface with known color coordinates. A ColorCheckerTM table is available as an alternative. This table has 24 color fields according to the CIE STANDARD that can be used for calibration.

Furthermore, input IN0 can be used for performing white light balancing.

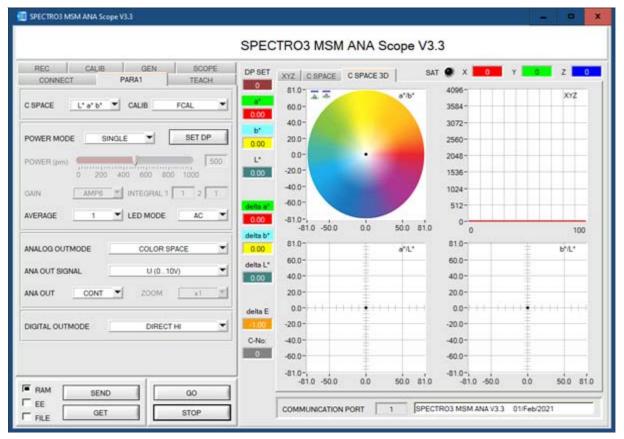

Parameterization

Windows® user interface:

(The current software version is available for download on our website.)

The color sensor is parameterized under Windows® with the SPECTRO3-MSM-ANA-Scope software. The Windows® user interface facilitates the teach-in process at the color sensor and supports the operator in the task of adjustment and commissioning of the color sensor.

The RS232 interface (tab PARA1) is used for setting parameters such as e.g.:

- POWER MODE (SET DP):	Light power of the LED (Set Double Parameter)
- LED MODE:	Triggering of the internal light source (AC, DC)
- GAIN:	Used for setting the gain of the receiver (AMP1 AMP8)
- AVERAGE:	Averaging over a maximum of 32768 values. This function field is used for adjusting the number of scanning values (measurement values) over which the raw signal measured at the receiver is averaged. A higher AVERAGE default value reduces noise of the raw signals at the receiver unit and there will be a decrease of the maximal available switching frequency of the sensor
- INTEGRAL:	This function field is used to set the number of scan values (measurement values) over which the raw signal measured at the receiver is summed up. This integral function allows the reliable detection even of extremely weak signals
- C SPACE:	Selection of a color space ((L*a*b* , L*C*h* , L*u*v*, L*u'v', or xyY) for the calculation of the color stimulus specification
- ANA LOG OUTMODE:	Function to determine the signals that the sensor provides at its analog outputs (OUT2, OUT3, OUT4) (OFF, XYZ, COLOR SPACE, CS REF)
- EVALUATION MODE:	BEST HIT or FIRST HIT
- TRIGGER:	Continuous or external or self trigger (CONT, EXT1, EXT2, TRANS)
- EXTEACH:	In all the evaluation modes teaching of a color can be performed externally through IN0.
- INTLIM:	Minimum intensity required for color evaluation
- MAXCOL-No.:	Number of colors to be checked
- DIGITAL OUTMODE:	Control of the two digital outputs (OUT0, OUT1)
Tab TEACH	Opens a window where you can teach colors to the TEACH TABLE
Tab CALIB	Selection of calibration mode (FCAL = factory calibration or UCAL = user calibration).
Tab SCOPE	Visualises an oscilloscope
Tab GEN	Displays the current temperature value TEMP in the sensor housing
Tab REC	Data recorder

Instruments

Firmware Update

Windows® software "FirmwareLoader":

(The current software version is available for download on our website.)

The software "Firmware Loader" allows the user to perform an automatic firmware update. The update will be carried out through the RS232 interface.

An initialisation file (xxx.ini) and a firmware file (xxx.elf.S) are required for performing a firmware update. These files can be obtained from your supplier. In some cases an additional firmware file for the program memory (xxx.elf.p.S) is also needed, and this file will be automatically provided together with the other two files.

Windows® software "SPECTRO3-MSM-ANA-Monitoring":

(The current software version is available for download on our website.)

The software "SPECTRO3-MSM-ANA-Monitoring" was developed for configuring up to 8 color sensors of the SPECTRO-3-MSM-ANA series in a multi-sensor system that can be used for the continuous inline measurement and control of surfaces at several measuring points at the same time. Measurement values are recorded and are also displayed at the PC monitor, and they can be printed out after the end of recording.

The software concept provides two user levels: A password-protected administrator function for configuring the inline measurement system and for setting all the parameters for operation, and an easy-to-use user function that only allows the setting of the start and end of recording with input of production parameters (that have been determined by the administrator). The print function also is available for the normal user.

As a support for commissioning and operation of the SPECTRO3-MSM-ANA-MONITORING software this manual explains the individual functional elements of the graphic Windows® user interface.

Sensor

Accessories

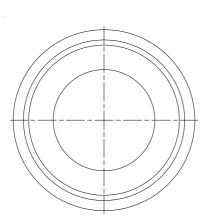

SPECTRO-3-15-OFL Top-part for optics (spacer) (please order separately)

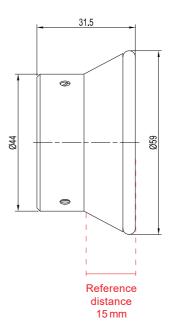

Mounted on the ring optics of the sensor the spacer makes it possible to use the sensor as a hand-held.

For color measurement, the sensor with the spacer is put directly on the surface of the object to be measured.

With the help of the spacer, the sensor works at a reference distance of 15 mm to the object respectively surface to be measured by direct contact.

Mounting example:

Instruments

All dimensions in mm

Accessories

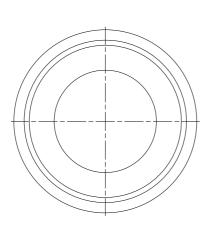

SPECTRO-3-30-OFL Top-part for optics (spacer) (please order separately)

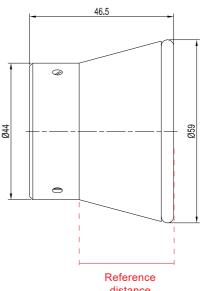

Mounted on the ring optics of the sensor the spacer makes it possible to use the sensor as a hand-held.

For color measurement, the sensor with the spacer is put directly on the surface of the object to be measured.

With the help of the spacer, the sensor works at a reference distance of 30 mm to the object respectively surface to be measured by direct contact.

distance 30 mm

Mounting example:

Spacer SPECTRO-3-30-OFL, for axample mounted on SPECTRO-3-30-DIL

All dimensions in mm
